Prophenol oxidase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to compounds comprising an immunogenic ligand whose sequence is based in part on residues 42-50 of human cancer antigon ATF4(FRB-2 (fort defined) and the polynuclectides encoding them. Also included are an antibody that specifically recognises and binds the compound, a method for inducing an immune response in a subject by delivering the compound, a method of immunohersepy comprising deministering to a subject the antibody, an immune effector cell that has been raised in vitro or in vivo in the presence and at the expense of an antigon presenting cell that presents the immunogenic compound in the context of an MTC (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune response of a context cell in gene therapy comprising administering an immune response of the synthetic and naturally occurring compounds. The compounds are useful for modulating an immune response to the synthetic and naturally occurring compounds. The compounds are useful for modulating an antibodies for the compounds are useful for immunotherapy when administered to a nitbodies are further useful for immunotherapy when administered to a subject. The peptides, polypeptides and polynucieotides are useful in diagnostic methods, for the detection and purification of antibodies. The present compounds are antigen and polynucieotides are useful in diagnostic methods, for the detection and purification of antibodies. The present compounds are antigen ATP4/CRBB-2 based immunogenic compounds and purification of antibodies. The present and purification of antibodies. The present and man cancer antigen ATP4/CRBB-2 based immunogenic compounds and purification of antibodies. The present antigen and purification of antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, cancer antigen, ATF4; CREB-2; vaccine; cytostatic; immunogenic ligand; gene therapy; MHC; major histocompatibility complex; adoptive immunotherapy; cancer; ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Note: Immunogenic ligands AAU74681-AAU74686 are stated to be encoded by the degenerate DNA sequences AAS20120-AAS20125 respective) but have not been cross-referenced or CDS features put in due to the degeneracy of the DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Gaps
New therapeutic compounds comprising immunogenic ligands, useful for
                     modulating an immune response, particularly for treating ovarian cancer, and as components of anticancer vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human cancer antigen ATF4/CREB-2 based immunogenic ligand #4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 61; DB 23; Length 9; 100.0%; Pred. The invention relates to compounds comprising an immunogenic ligand whose sequence is based in part on residues 42-50 of human cancer antigen AFF4/CRBB-2 (not defined) and the polywacleotides encoding them. Also included are an antibody that specifically recognises and binds the compound, a method for inducing an immune response in a subject by delivering the compound, a method of immunotherapy comprising that has administering to a subject the antibody, an immune effector cell that presents the immunogenic compound in the context of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune response of context of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune response of the synthetic and naturally occurring compounds. The compounds are useful for modulating an immune response of the synthetic and naturally occurring compounds. The compounds are useful for treating cancer, particularly vaccines. The compounds are useful for treating cancer, particularly recognise and bind to these molecules. These antibodies are further useful for immunotherapy when administered to a castimodes are pecifically recognise and bind to these molecules. These antibodies are further useful for immunotherapy when administered to a castimunogens for the production and purification of antibodies, or as immunogens for the production of antibodies. The present income of the invention of a human cancer antigen ATF4/CREP-2 based immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Note: Immunogenic ligands AAU74681-AAU74686 are stated to be encoded by the degenerate DNA sequences AAS20120-AAS20125 respectively but have not been cross-referenced or CDS features put in due to the

                                                                                                                                                                                                                                                                                                             엄
                                                                                                                                                                                                                                                                                                                                                                                                            à
                                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in factivity. The polypeptide and polynucleotide sequences have applications in diagnostics, foremsics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AEG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                            0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                Gaps
Pure and recombinant human Telomerase Reverse Transcriptase and its variants - are useful in the diagnosis, prognosis and treatment of cell proliferation conditions especially cancer and ageing
                                                                                                                                                                                                                                                                                                                                                                                                  Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; SEQ ID NO 5304; 21pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher wekaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL10176-ABL10511), expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

Peptide Peptide Peptide Peptide

```
This protein is a prophenol oxidase derived from a domestic silkworm. The phenol oxidase may be used as a novel labelling oxidase. The elucidation of the primary structure of the prophenol oxidase will contribute to the reconstitution of a prophenol oxidase activation which can be applied to the detection of microorganisms by measurement of beta-1,3-glucan and peptide glycan.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers -

therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing finactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell compared to the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAM37196 to AAM37204 and AAB37789 represent sequences used in the exemplification of the present invention.

N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922.

which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipordatic; antiparkinsonian; nootropic; neuropiccetive; onteopathic; antiporavisatic antianthat; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; untidiabetic; hypotensive; dermatological; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressave; antidiabetic; hypotensive; dermatological; immunosuppressave; antidiabetic; hypotensive; dermatological; immunosuppressave; antidiabetic; hypotensive; dermatological; immunosuppressave; antidiantency; and antidaneemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating the proteins and nucleic acids way be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, grathematosus, severe combined immunodeficiency (SCID), AIDS, viral, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus crythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal heemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ORF; open reading frame; ORFX; drug screening; diagnosis; disease monitoring; cytokine; cell proliferation; cell differentiation; mamme modulation; hamantopoiesis regulation; tissue growth; angiogenesis; activin; inhibin; chemotactic; chemokinetic; hamostatic; thrombolytic; tumour inhibition; bodily characteristic; fertility; behaviour; cancer; proliferative disorder; neurological disorder; cardiovascular disease; immune system disorder; organ transplantation; tissue growth disorder; tissue regeneration disorder; diabetes mellitus; hypothyroidism; cholesterol ester storage disease; infection; vulnerary; vasotropic; antipsoriatic; antidiabetic; cytostatic; nootropic; neuroprotective; antiatheroselerotic; anticoagulant; thrombolytic; cardiant; hypotensive; antithyroid; antibacterial; fungicide.

Mycobacterium leprae.

```
C designated ORF (open reading frame) 1-4534, and sequences ABM7504-
ABM79587 represent cDNAs encoding them. The invention also encompasses
C ABM79587 represent cDNAs encoding them. The invention also encompasses
C DOLYpeptides at least 80% identical to the ORF1-ORF434 (collectively)
C Februed to as ORFX) proteins, polymucleotides at least 85% identical to
C referred to as ORFX) proteins, polymucleotides at least 85% identical to
C polypeptides, methods of screening for modulators of ORFX proteins antibodies
C polypeptides, methods of screening individuals for a predisposition or
activity, and methods of screening individuals for a predisposition to an
ORFX-associated disorder. The ORFX proteins of the invention have a wide
C range of biological activities, such as cytokine, cell proliferation,
c range of biological activities, such as cytokine, cell proliferation,
c range of biological activity, hammen modulation, haematopoiesis regulation,
c range of biological activity, and may also be involved in the determination
c tissue growth, angiogenesis, activin or inhibin activity,
c elemokinheit activity, and may also be involved in the determination
c bodily characteristics, fertility and behaviour. ORFX proteins,
c chemokinheit and antibodies may be used in the treatment of cancers,
c other proliferation, disorders such as spoilapsy and Alzheimer's disease,
c other proliferation, disorders such as spoilapsy and Alzheimer's disease,
c other proliferation, disorders such as spoilapsy and Alzheimer's disease,
c other proliferation, disorders such as goowth and regeneration,
c storage disease, and infectious diseases caused by viral, bacterial,
c fungal and other pathogens.
C cradiovascular dispenses melliums, hypothyroidism, and cholesterol
c storage disease, and infectious diseases caused by viral, bacterial
c fungal and other pathogens.
C cradiovascular dispenses melliums, hypothyroidism, and other payents
c fungal and other proliferation and or or Respublic and an induction and or or reasoriate and probes, in the

The invention relates to recombinant membrane targeting and translocation proteins from Escherichia coli. The recombinant relates to polypeptides are involved in the Sec-independent pathway for transport to proteins with a twin- arginine signal peptide to the periplasm or created lular medium and to the cell membrane. They transport fully folded and co-factor containing proteins. The polypeptides are used to transport such proteins, specifically to produce soluble forms of polypeptides that are normally produced in insoluble form. They may also be used to raise specific antibodies. Nucleic acid sequences that encode the polypeptides are used as probes to detect or isolate related genomic the polypeptides and humans. Producing normally insoluble proteins and their fragments and humans. Producing normally insoluble proteins in class, nematodes and humans. Producing normally insoluble proteins in class of the properly folded by cytoplasmic enzymes before translocation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                  New recombinant membrane targeting and translocation proteins from Bscherichia coli, used to produce soluble polypeptides normally produced in insoluble form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ND5-81
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 21-JUN
  The invention relates to isolated polymucleotide (I) and polymerase chain reaction (FRR) primers, oligomers, and for chromosome polymerase chain reaction (FRR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The conditions are also used in diagnostics as expressed sequence tags polymucleotides axer also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques for restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in companies for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Abd00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                             New isolated polynuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .;
